0.36° Closed Loop Stepping Motor and Driver Package α STEP High-Efficiency AR Series

● Connection information ●
 Technical reference → Page G-1
 Safety standards → Page H-2

This series substantially reduces heat generation from the motor through the use of high-efficiency technology. It allows you to take advantage of the beneficial features of the stepping motor to perform quick positioning operations over a short distance repeatedly without worrying about the duty cycle.

● For detailed product safety standard information including standards, file number and certification body, please visit www.orientalmotor.com.

Features

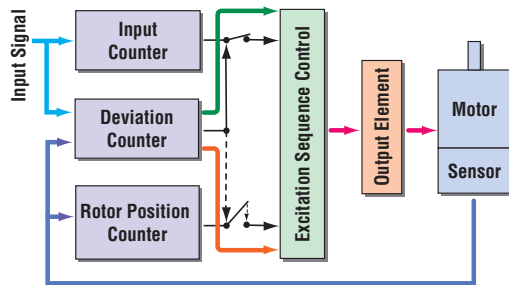

● Uses Oriental Motor's Original Closed Loop Control Technology

◇ Maintains Operation Even During Abrupt Load Fluctuations and Accelerations.

The **AR** Series uses our closed loop control to maintain positioning operation even during abrupt load fluctuations and accelerations.

The rotor position detection sensor monitors the rotation.

When an overload condition is detected, the **AR** Series will instantaneously regain control using the closed loop mode.

Normal (Positioning deviation is less than $\pm 1.8^\circ$)

Motor runs in open loop mode like a stepping motor.

During Overload Condition (Positioning deviation is $\pm 1.8^\circ$ or more)

The closed loop mode is engaged to maintain the positioning operation.

◇ Rotor Position Detection Sensor

The rotor position detection sensor uses the change in inductance caused by change in the distance between the stator teeth and the teeth on the sensor rotor to detect rotor position.

- This structure can be made small and thin, so the overall size of the motor can be reduced.
- High resolution
- This structure does not use electronic parts, so it is not affected by heat or vibration.

Sensor detects rotor position

● Alarm Signal Output in Case of Abnormality

If an overload is applied continuously, an alarm signal is output. When the positioning is complete, an END signal is output. This ensures the same level of reliability achieved by a servo motor.

● Maintaining All the Beneficial Features of a Stepping Motor

◇ High Response

The motor operates synchronously with pulse commands to achieve high response. There's no delay in operation following a pulse command.

◇ No Tuning

With the **AR** Series, you can perform positioning quickly after a load change, etc., without adjusting any gains.

◇ No Hunting

Because it uses a stepping motor, the **AR** Series does not hunt when stopped. Accordingly, the **AR** Series is ideal for applications where the equipment uses a belt-drive mechanism or otherwise has low rigidity and you don't want it to vibrate when stopping.

● Compact DC Input Driver with Plastic Case

The compact DC power input driver is covered by a plastic case. The compact size is great for space-saving. You can attach this driver to a 35 mm (1.38 in.) width DIN rail through one-step operation, no screw is needed. (DIN rail mounting is the only way to install the driver.)

◇ Push Motion

The load is pressurized continuously. When contact is made with the load, pushing operation begins, and the pressurization can be carried out at a steady torque.

◇ 24/48 VDC

Choose the appropriate power supply 24 VDC or 48 VDC for your application. Motor torque at speed will be increased when 48 VDC is input rather than 24 VDC. [Only 24 VDC input is available for motor frame size 28 mm (1.10 in.) motors.]

AR66AK-3

● Continuous Operation is Achieved Due to the Reduction of Motor Heat Generation by Utilizing High-Efficiency Technology

◇ Lower Heat Generation

The AR Series utilizes high-efficiency technology to achieve a significant reduction in the amount of heat generated from the motor.

● Temperature Distribution by Thermography

Comparison under the same conditions

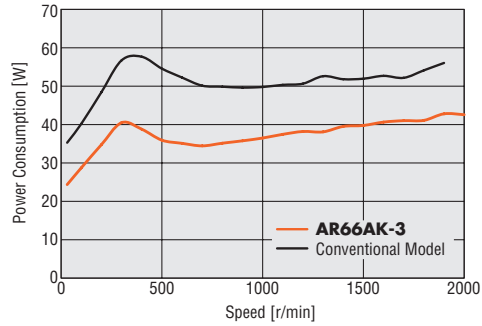

● Motor Case Temperature under Same Operating Conditions

◇ Energy-Saving

Power consumption: up to **30%** less than a conventional model

● Power Consumption

CO₂ emission: up to **30%** less* than a conventional model

*Assuming operation at a duty of 40%

◇ Continuous Operation or Operation at a high Duty Cycle

The AR Series can be operated at high frequency. You can drive the motor continuously.

Note

● If the motor is operated continuously, a heat sink of a capacity at least equivalent to an aluminum plate with a size of 100×100 mm (3.94×3.94 in.), 6 mm (0.24 in.) thick is required.

The following items are included each product.

Motor, Driver, Cable for Motor, Cable for Electromagnetic Brake*, I/O Signal Connector, Connector for Power Supply Input/Frame Ground Terminal, Surge Suppressor*, Operating Manual, USER MANUAL (CD-ROM)

● Each product comes with cables for motor and electromagnetic brake 3 m (9.8 ft.) long.

If you need different length cable, or flexible cables, select an appropriate cable from among the accessories (sold separately). For details, refer to page A-400.

* Only with Electromagnetic Brake Type.

- *1 The values inside the brackets [] represent the specification for the electromagnetic brake type.
- *2 When running the motor at 48 VDC, the load inertia should be under 10 times of the rotor inertia and allow for a safety factor of 2 or more times the required torque.
- *3 A separate power supply is required for the electromagnetic brakes.
- *4 If the distance between the motor and driver is extended to 20 m (65.6 ft.) or longer, use a power supply of 24 VDC±4%.

AR46 Gear Ratio 50

AR46 Gear Ratio 100

Notes

- Pay attention to heat dissipation from the motor as there will be a considerable amount of heat under certain conditions. Be sure to keep the temperature of the motor case under 100°C (212°F).
- In order to prevent fatigue of the gear grease in the harmonic gear, keep the temperature of the gear case under 70°C (158°F).

Specifications RoHS

Model	Single Shaft	AR66AK-H50-3	AR66AK-H100-3	AR98AK-H50-3	AR98AK-H100-3
	Electromagnetic Brake	AR66MK-H50-3	AR66MK-H100-3	AR98MK-H50-3	AR98MK-H100-3
Maximum Holding Torque	N·m (lb·in)	5.5 (48)	8 (70)	25 (220)	37 (320)
Rotor Inertia	J: kg·m ² (oz·in ²)	415×10 ⁻⁷ (2.3)	535×10 ⁻⁷ (2.9) ^{*1}	1300×10 ⁻⁷ (7.1)	1420×10 ⁻⁷ (7.8) ^{*1}
Gear Ratio		50	100	50	100
Resolution	Resolution Setting: 1000P/R	0.0072°/Pulse	0.0036°/Pulse	0.0072°/Pulse	0.0036°/Pulse
Permissible Torque	N·m (lb·in)	5.5 (48)	8 (70)	25 (220)	37 (320)
Maximum Torque	N·m (lb·in)	18 (159)	28 (240)	35 (300)	55 (480)
Holding Torque at Motor Standstill	Power ON	N·m (lb·in)	8 (70)	25 (220)	37 (320)
	Electromagnetic Brake	N·m (lb·in)	5.5 (48)	8 (70)	25 (220)
Lost Motion (Load Torque)	arc min	0.7 max (±0.28 N·m)	0.7 max (±0.39 N·m)	1.5 max (±1.2 N·m)	
Permissible Speed Range	r/min	0~60	0~30	0~40	0~20
Power Supply Input	Voltage	24 VDC±10%/48 VDC±5% ^{*2}			
	Maximum Input Current	A	3.1		2.5
Electromagnetic Brake ^{*3}	Power Supply Input	24 VDC±5% ^{*4} 0.25 A			

*1 The values inside the brackets [] represent the specification for the electromagnetic brake type.

*2 When running the motor at 48 VDC, the load inertia should be under 10 times of the rotor inertia and allow for a safety factor of 2 or more times the required torque.

*3 A separate power supply is required for the electromagnetic brakes.

*4 If the distance between the motor and driver is extended to 20 m (65.6 ft.) or longer, use a power supply of 24 VDC±4%.

Note

● The inertia represents a sum of the inertia of the harmonic gear converted to a motor shaft value, and the rotor inertia.

AR98 Gear Ratio 100

Notes

- Pay attention to heat dissipation from the motor as there will be a considerable amount of heat under certain conditions. Be sure to keep the temperature of the motor case under 100°C (212°F).
- In order to prevent fatigue of the gear grease in the harmonic gear, keep the temperature of the gear case under 70°C (158°F).

Driver Specifications

Speed and Positioning Control Command	Pulse input
Maximum Input Pulse Frequency	When the host controller is a line driver output: 500 kHz (When the pulse duty is 50%) When the host controller is an open-collector output: 250 kHz (When the pulse duty is 50%)*
Protective Functions	When the following protective functions are activated, an alarm signal is output and the motor will coast to a stop. Overheat, Overload, Overspeed, Command pulse error, Overvoltage, Undervoltage, Overflow rotation during current on, Overflow rotation during current off, Abnormal operation data, Electronic gear setting error, Sensor error during operation, Initial sensor error, Initial rotor rotation error, Motor combination error, EEPROM error
Input Signals	Photocoupler input, Input resistance: 3 kΩ, Input signal voltage: 4.75 to 26.4 V (C-ON, FREE, CS, RETURN, P-RESET, CLR/ALM-RST, CCM, MO, M1, M2) Photocoupler input, Input resistance: 200 Ω, Input signal voltage: 3 to 5.25 V (CW/PLS, CCW/DIR) Photocoupler input, Input resistance: 2.7 kΩ, Input signal voltage: 21.6 to 26.4 V (CW24V/PLS24V, CCW24V/DIR24V)
Output Signals	Photocoupler, Open-collector output External use condition: 30 VDC maximum, 10 mA maximum (READY, TLC, END, TIM2, WNG, ALM) Line driver output External use condition: Connect a terminal resistor of 100 Ω or more between the driver and the input of the line receiver. (TIM1, ASG, BSG)
Other Functions	<ul style="list-style-type: none"> Motor resolution setting function (4 levels) Current setting function (16 levels) Velocity filter function (16 levels) Pulse input setting function (2-pulse input, 1-pulse input) Current control mode function
Extended Functions [When the control module (OPX-2A) or data setting software (MEXE02) (both sold separately) is used]	<ul style="list-style-type: none"> Push-motion operation function (8 current levels; desired levels can be set within a range of 0 to 100%) Motor resolution setting function (electronic gear) Alarm code output function (3 bits) Current setting function (16 levels; desired levels can be set within a range of 0 to 100%) Velocity filter function (16 levels; desired levels can be set within a range of 0 to 200 ms) Current ON (C-ON) input logic setting function Positioning completion (END) signal width setting function Positioning completion (END) signal offset setting function Standstill current setting function Return operation setting function (starting speed, acceleration/deceleration rate, operating speed) JOG operation setting function (starting speed, acceleration/deceleration rate, operating speed) OPX-2A display setting function (gear output shaft speed, speed code display, setting change prohibition) Pulse input setting function (2-pulse, 1-pulse, logic, phase difference, multiplication) Smooth drive cancellation Motor excitation position setting function at power ON Excitation position reset operation function at current ON Motor rotation direction setting function Warning output setting function (overflow rotation during current on, overflow rotation during current off, overheat, overvoltage, undervoltage, overload, overspeed, abnormal operation data, electronic gear setting error)

*Value applies when an accessory general-purpose cable (**CC36D1-1**) is used. General-purpose cable → Page A-402

General Specifications

Item	Motor	Driver
Thermal Class	130 (B)	—
Insulation Resistance	100 MΩ or more when 500 VDC megger is applied between the following places: • Case – Motor and sensor windings • Case – Electromagnetic brake windings	—
Dielectric Strength	Sufficient to withstand the following for 1 minute: • Case – Motor and sensor windings 1.0 kVAC 50 Hz or 60 Hz • Case – Electromagnetic brake windings 1.0 kVAC 50 Hz or 60 Hz	—
Operating Environment	Ambient Temperature	−10~+50°C (+14~+122°F) (non-freezing)*1: Step Angle 0.36° Standard type, TH, PS, PN geared type 0~+40°C (+32~+104°F) (non-freezing)*1: Harmonic geared type
	Ambient Humidity	85% or less (non-condensing)
	Atmosphere	No corrosive gases, dust, water or oil
Degree of Protection	IP54 (Double shaft type, AR24 and AR26 : IP20)*2	IP20
Stop Position Accuracy	AR24, AR26, AR46 : ±4 arc minutes (±0.067°) AR66, AR69, AR98 : ±3 arc minutes (±0.05°)	
Shaft Runout	0.05 mm (0.002 in) T.I.R.*3	—
Concentricity	0.075 mm (0.003 in) T.I.R.*3	—
Perpendicularity	0.075 mm (0.003 in) T.I.R.*3	—

*1 When a heat sink of a capacity at least equivalent to an aluminum plate with a size of 100×100 mm (3.94×3.94 in), 6 mm (0.24 in.) thick is installed.

*2 Excluding the mounting surface and connector

*3 T.I.R. (Total Indicator Reading): The total dial gauge reading when the measurement section is rotated one revolution centered on the reference axis center.

Note

● Do not measure insulation resistance or perform the dielectric strength test while the motor and driver are connected.

Permissible Overhung Load and Permissible Thrust Load

Load Torque – Driver Input Current Characteristics

This is the relationship between the load torque and driver input current at each speed when the motor is operated. From these characteristics, the current capacity required when used for multiple axes can be estimated. For geared motors, convert to torque and speed at the motor shaft.

$$\text{Motor shaft speed [r/min]} = \text{Gear output shaft speed} \times \text{Gear ratio}$$

$$\text{Motor shaft torque [N}\cdot\text{m (oz}\cdot\text{in)}] = \frac{\text{Gear output shaft torque}}{\text{Gear ratio}}$$

● Driver

Mass: 0.17 kg (0.37 lb.)

DXF B546

- Control I/O Connector (CN5)
Cover Assembly: 10336-52A0-008 (SUMITOMO 3M)
Connector: 10136-3000PE (SUMITOMO 3M)
- Connector for Power Supply Input/Frame Ground Terminal (CN1)
Connector: MC1.5/3-STF-3.5 (PHOENIX CONTACT)

● Connection Cables (Included)

● Cable for Motor

For AR24 and AR26

● Cable for Electromagnetic Brake (Only for electromagnetic brake type)

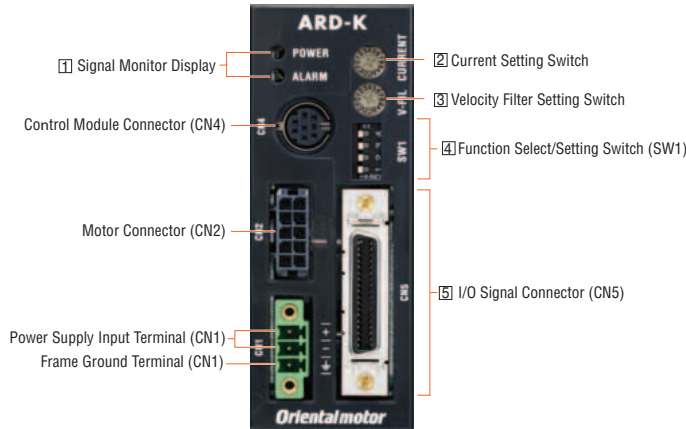

For AR46, AR66, AR69 and AR98

Connection and Operation

Names and Functions of Driver Parts

1 Signal Monitor Displays

◇ LED Displays

Indication	Color	Function	When Activated
POWER	Green	Power supply indication	Lights when power is on.
ALARM	Red	Alarm indication	Blinks when protective functions are activated.

◇ Alarms

Blink Count	Function	When Activated
2	Overheat	The temperature inside the driver rises above 85°C (185°F).
	Overload	When the amount of time during which the load torque exceeded the maximum torque exceeds the overload detection time. (Default value: 5 seconds)
	Overspeed	The motor output shaft speed exceeds 4500 r/min.
	Command pulse error	The command pulse value becomes abnormal.
3	Overvoltage	The primary voltage of the driver's inverter exceeds the upper limit.
	Undervoltage	The primary voltage of the driver's inverter drops below the lower limit.
4	Overflow rotation during current on	The position deviation exceeds the overflow revolutions. (Default value: 3 revolutions)
	Overflow rotation during current off	The current is turned on even though the position deviation when the current is turned off was equal to or greater than the permissible value. (Default value: 100 revolutions or more)
7	Abnormal operation data	Return to electrical home operation is performed while an operation data error warning is present.
	Electronic gear setting error	The resolution set by the electronic gear is outside the specified range.
	Sensor error during operation	A sensor error occurs while the motor is rotating.
8	Initial sensor error	The power source is turned on when the motor cable is not connected to the driver.
	Initial rotor rotation error	The main power is turned on while the motor is rotating.
	Motor combination error	A motor not supported by the driver is connected.
9	EEPROM error	A motor control parameter is damaged.

2 Current Setting Switch

Indication	Switch Name	Function
CURRENT	Current setting switch	This switch adjusts the operating current. It is used to limit the torque and temperature rise. A desired current can be set as a percentage (%) of the rated output current. The factory setting is "F".

3 Velocity Filter Setting Switch

Indication	Switch Name	Function
V-FIL	Velocity filter setting switch	<p>This switch adjusts the motor response. Adjust the switch if you want to suppress motor vibration or cause the motor to start/stop smoothly. "0" and "F" correspond to the minimum and maximum velocity filter settings, respectively. The factory setting is "1."</p> <p>The difference in characteristics made by the velocity filter</p>

PK	Geared	0.36° / Geared	Geared		

4 Function Select/Setting Switches

Indication	Switch Name	Function
4	Resolution select switches "D0/D1" "CS0/CS1"	These switches are used to set the resolution per rotation of the motor output shaft. "4:OFF" "3:OFF"→1000 pulse (0.36°/step) [Factory setting] "4:OFF" "3:ON"→10000 pulse (0.036°/step)
3		"4:ON" "3:OFF"→500 pulse (0.72°/step) "4:ON" "3:ON"→5000 pulse (0.072°/step)
2	Control mode select switches "NORM/CCM"	This switch toggles the driver between the normal mode and current control mode. In the current control mode, noise and vibration can be reduced although the motor synchronicity may reduce. "OFF": Normal mode [Factory setting] "ON": Current control mode
1	Pulse input mode switch "2P/1P"	The settings of this switch are compatible with the following two types of pulse input modes: "OFF": 2-pulse input mode "ON": 1-pulse input mode [Factory setting]

5 I/O Signal Connector (CN5, 36 pins)

Indication	Input/Output	Pin No.	Signal		Signal Name	
			Positioning Operation	Push-Motion Operation	Positioning Operation	Push-Motion Operation*1
CN5	—	1	—		—	
	Output	2	GND		Ground connection	
		3	ASG +		A-phase pulse output (line driver)	
		4	ASG -		A-phase pulse output (line driver)	
		5	BSG +		B-phase pulse output (line driver)	
		6	BSG -		B-phase pulse output (line driver)	
		7	TIM1 +		Timing output (line driver)	
		8	TIM1 -		Timing output (line driver)	
		9	ALM +		Alarm output	
		10	ALM -		Alarm output	
		11	WNG +		Warning output	
		12	WNG -		Warning output	
		13	END +		Positioning complete output	
		14	END -		Positioning complete output	
		15	READY + /AL0 +		Operation ready complete output/Alarm code output 0*1	
		16	READY - /AL0 -		Operation ready complete output/Alarm code output 0*1	
		17	TLC + /AL1 +		Torque limit output /Alarm code output 1*1	
		18	TLC - /AL1 -		Torque limit output /Alarm code output 1*1	
		19	TIM2 + /AL2 +		Timing output (open-collector)/Alarm code output 2*1	
		20	TIM2 - /AL2 -		Timing output (open-collector)/Alarm code output 2*1	
		21	GND		Ground connection	
	Input	22	IN-COM		Input signal common	
		23	C-ON		Current on input*2	
		24	CLR/ALM-RST		Deviation counter clear input/Alarm reset input	
		25	CCM		Current control mode ON input	
		26	CS	T-MODE	Resolution select input	Push-motion operation ON*1
		27	—	M0	—	—
		28	RETURN	M1	Return to electrical home operation	Push-current setting select input*1
		29	P-RESET	M2	Position reset input	Push-current setting select input*1
		30	FREE		Excitation OFF	
		31	PLS + /CW +		Pulse input/CW pulse input (+5 V/line driver)	
		32	PLS - /CW -		Pulse input/CW pulse input (+5 V/line driver)	
		33	PLS +24 /CW +24V		Pulse input/CW pulse input (+24V)	
		34	DIR +24 /CCW +24V		Direction input/CCW pulse input (+24V)	
		35	DIR + /CCW +		Direction input/CCW pulse input (+5 V/line driver)	
		36	DIR - /CCW -		Direction input/CCW pulse input (+5 V/line driver)	

*1 The signal will become effective if the applicable setting has been changed using the accessory control module **OPX-2A** or the data setting software **MEXE02** (both sold separately).

*2 The factory setting of the C-ON input is normally open. Be sure to turn the C-ON input ON when operating the motor.

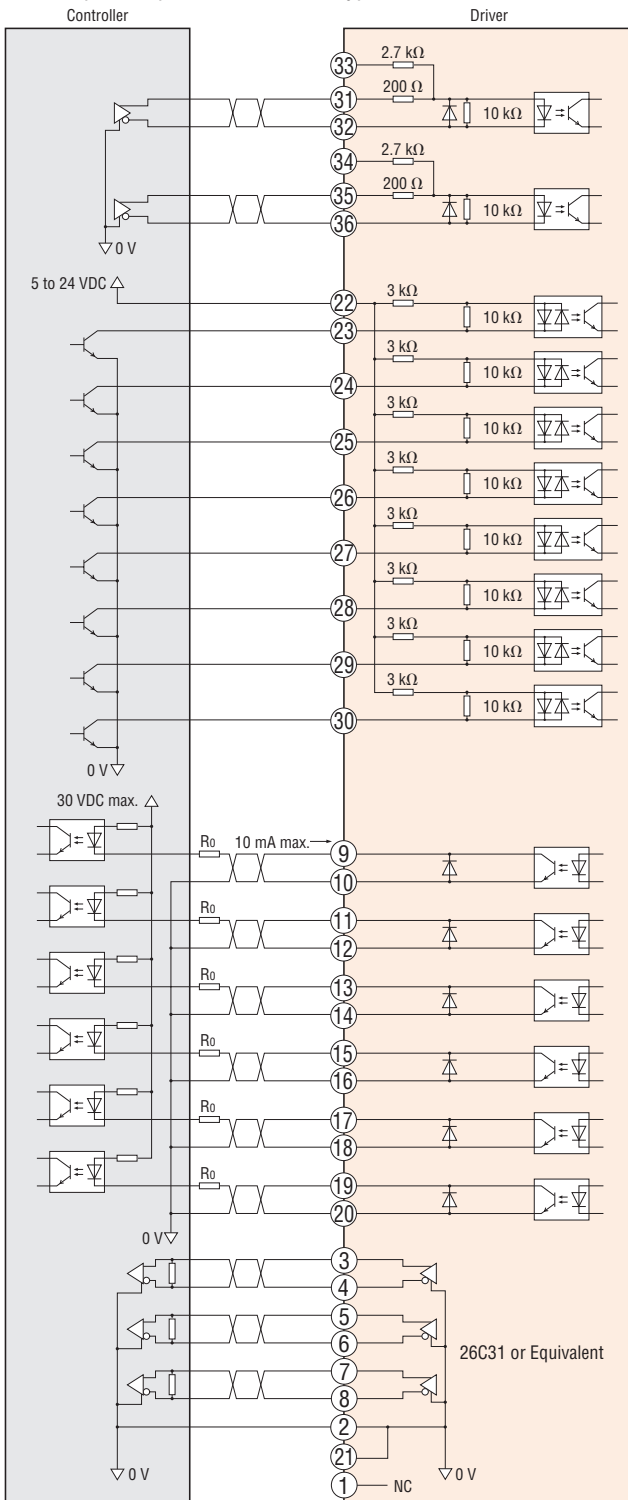

Set the C-ON input to normally close with a control module (**OPX-2A**, sold separately) or a data setting software (**MEXE02**, sold separately) when the C-ON input is not used.

● Connection Diagram

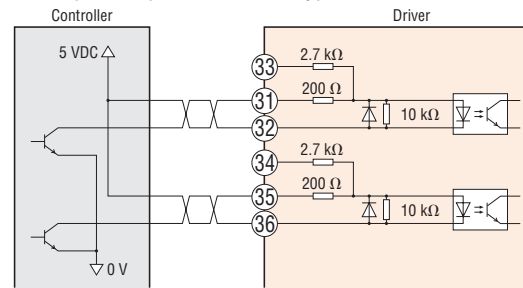

◇ Connecting to a Host Controller

● Connecting to a Current Sink Output Circuit

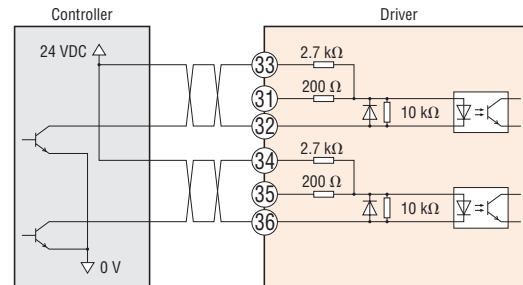

When pulse input is of line driver type

When pulse input is of 5 VDC type

When pulse input is of 24 VDC type

Notes

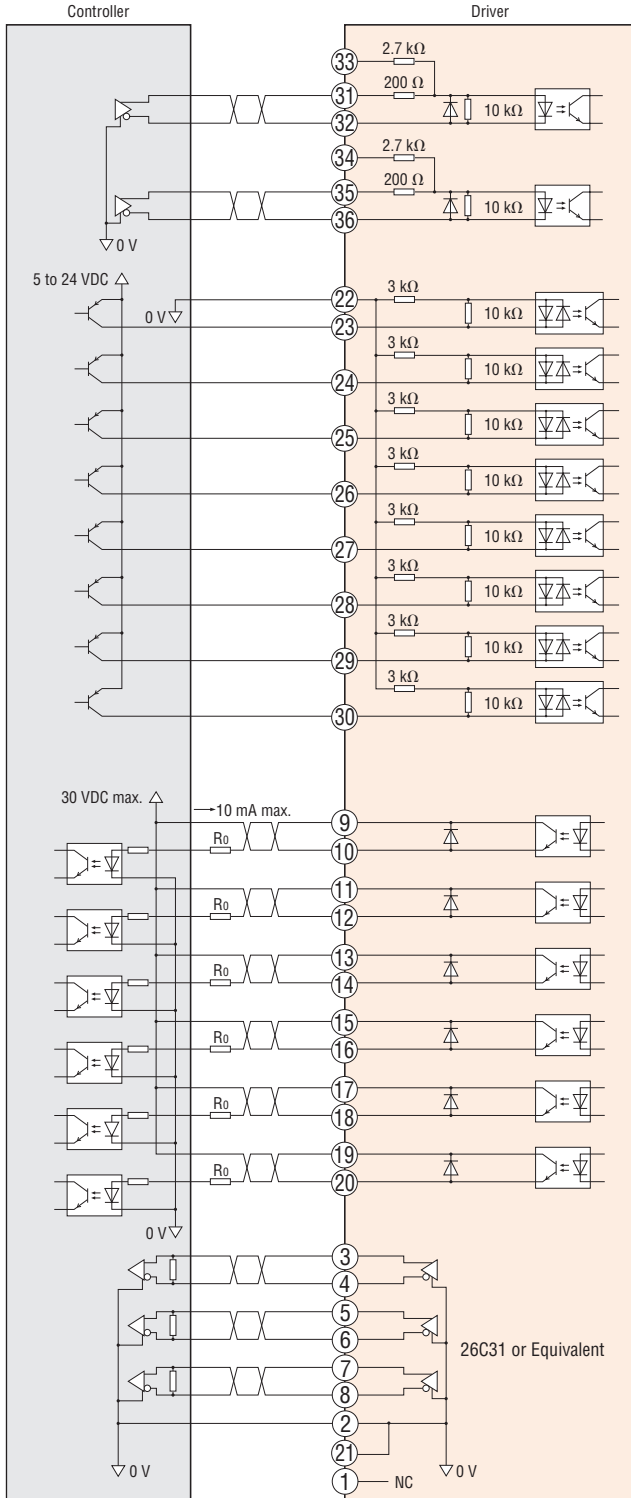

- Use output signals at 30 VDC or less. If the current exceeds 10 mA, connect an external resistor R_o .
- Connect a terminal resistor of 100 Ω or more between the input of the line receiver terminals.
- Use a multi-core, twisted-pair shielded wire of AWG28 to 24 for the control input/output signal line (CN5), and keep wiring as short as possible [within 2 m (6.6 ft.)].
- Note that as the length of the pulse signal line increases, the maximum transmission frequency decreases.
- Provide a minimum distance of 200 mm (7.9 in.) between the control I/O signal lines and power lines (AC lines, motor lines and other large-current circuits). Do not run the control I/O signal lines in the same duct as power lines or bundle them with power lines.

Extended Functions

With the accessory control module **OPX-2A** or data setting software **MEXE02** (both sold separately), extended functions of the **AR** Series are available. You can change the internal parameters of the driver, perform test operations and monitor the operation.

Control Module (**OPX-2A**)
→ Page A-430

Data Setting Software (**MEXE02**)
→ Page A-431

Parameter Setting

You can set the advanced settings of the signals and change the generation conditions of the alarm.

Application Parameter	Operating current	Current value assigned to the operating current setting switch	
	Speed filter	Filter time constant assigned to the speed filter setting switch	
	I/O	Input signal mode	Positioning operation/push-motion operation switching
		Alarm code signal enabled/disabled	
		C-ON input logic	
		Output condition for END signal (output width)	
	Normal mode	Current value applicable to push-motion operation	
		Standstill current in the normal mode	
	Current control mode	Speed difference gain in the normal mode	
		Position loop gain in the current control mode	
		Speed loop gain in the current control mode	
		Speed loop integral time constant in the current control mode	
	Alarm/Warning	Damping control enabled/disabled in the current control mode	
		Damping control vibration frequency in the current control mode	
		Operation data error warning enabled/disabled	
Generation condition of overflow rotation alarm during current on			
Generation condition of overflow rotation alarm during current off			
Generation condition of overload alarm			
Generation condition of overflow rotation warning			
Generation condition of overvoltage warning			
Return to electrical home operation	Generation condition of undervoltage warning		
	Generation condition of overheat warning		
	Generation condition of overload warning		
Manual operation	Generation condition of overspeed warning		
	Operating speed for return to electrical home operation		
	Acceleration/deceleration rate for return to electrical home operation		
Control module	Starting speed for return to electrical home operation		
	Operating speed for test operation		
Electronic gear	Acceleration/deceleration rate for test operation		
	Starting speed for test operation		
System Parameter (Becomes effective after the power is cycled)	Control module	Speed monitor display. Show the speed on the control module with a sign or as an absolute value Gear ratio for geared motor used for speed monitor	
	Operation setting	Resolution assigned to each resolution switch	
		Pulse input mode	
		Smooth drive enabled/disabled	
	Initial motor excitation position at power ON. Detected position/electrical angle 0° switching		
	Automatic return operation at current ON enabled/disabled		
	Motor rotation direction		

Monitoring

You can monitor various signals, alarms and motor speeds/positions, and also perform test operations.

Monitoring	Monitor positions
	Monitor speeds
	Monitor I/Os
Waveform monitoring*	Monitor positions*
	Monitor speeds*
	Measure waveforms*
	Save waveforms*
Test	Perform test operation (JOG operation)
	Monitor conditions during test operation
	Perform return to electrical home operation
	Forcibly turn output signals ON/OFF
Alarm	Check information on alarms that generated
	Check alarm history (10 most recent alarms)
	Clear alarm history
Warning	Cancel
	Check information on warnings that generated
	Check warning history (10 most recent warnings)
	Clear warning history

◇ Waveform Monitoring

You can monitor various signals and motor speeds/positions using waveforms.

● Other

- Electrical home reset
- Parameter initialization

*This function is available only when the data setting software (**MEXE02**) is used.
