Load data

Alpha Colonne mono

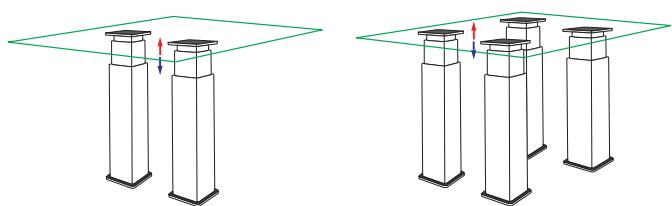

1-2 Alpha Colonnes in single or parallel operation

Parallel operation

The standard version also supports parallel operation of two Alpha Colonnes (no synchronisation). This may produce different lifting positions during operation, which can be levelled out by moving to the end positions.

Alpha Colonne synchro

2-4 Alpha Colonnes in synchronous operation

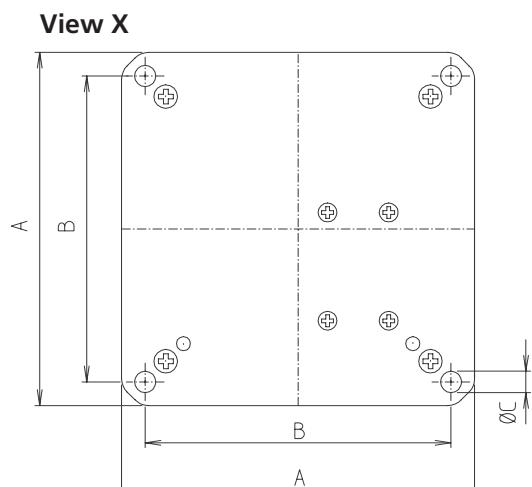

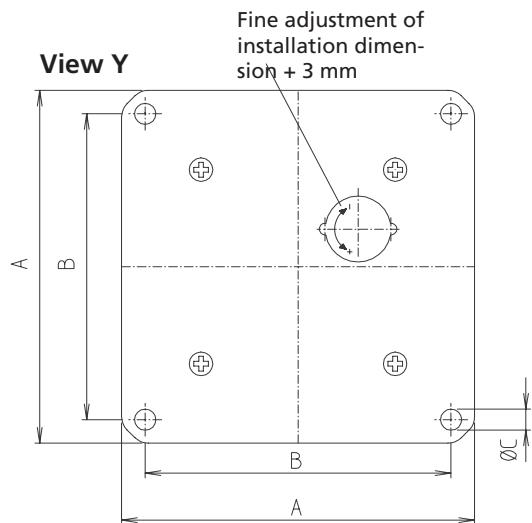

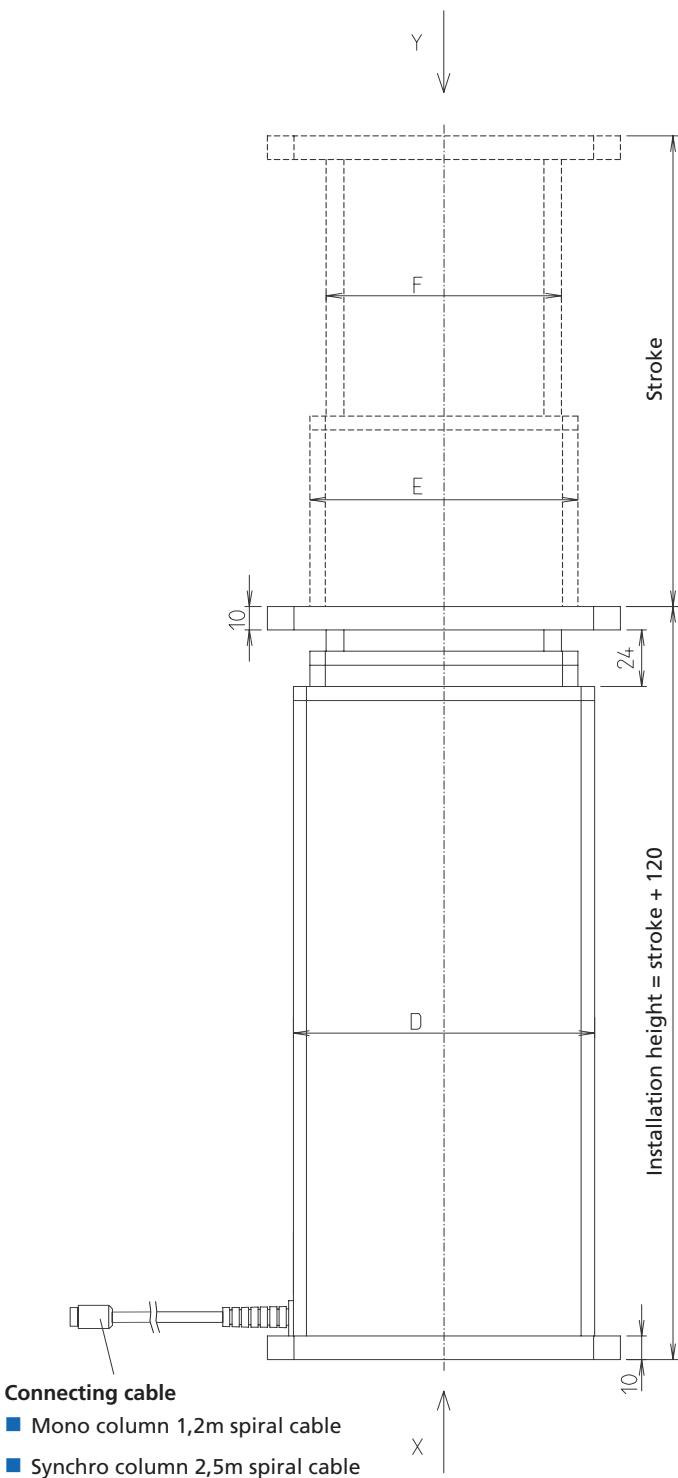

Synchronous operation

Synchronous operation of two or more columns. In conjunction with the integrated sensors, the control (see page 612) ensures synchronisation, and thus constant alignment of all the columns in both directions of travel, even if subject to different loads. The synchronous operation tolerance is max. 4 mm. A memory function is also available.

Alpha Colonne – Fixing

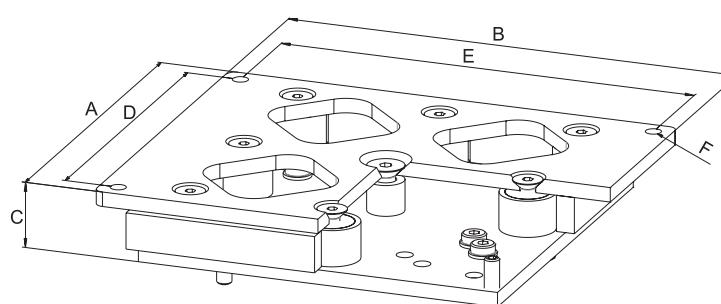

RK SyncFlex H

Scope of delivery:
Adjuster plate, incl. fixing material

Horizontal alignment

- To prevent locked-up stress in mechanically overdefined bearing systems (more than one fixed bearing) around the horizontal axis. With RK SyncFlex H defined loose bearings supplement the application.
- The horizontal compensation in the Z-axis enables the freedom of movement required when moving the lifting columns.

Alpha Colonne – Fixing/Position determination

RK SyncFlex V

Scope of delivery:

Adjuster plate, incl. fixing material

Option:

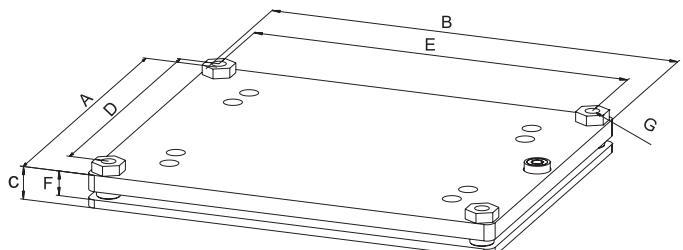

Optionally available with or without pressure plate (see table)

Vertical alignment

- If the lifting columns are not parallel, the distance between the two upper fixing points will change during the movement. However, a rigid connection keeps this distance constant, and this means that the lift-

ing columns are subject to very strong forces. RK SyncFlex V enables the compensation of unevenness in the mounting environment.

- The lifting columns can be aligned via the vertical adjustment around the X-Y axes.
